

Grid fat, multiply sharp — the crystallographic FFT trick

B-factor split

Agarwal / Ten Eyck idea

Why split?

Direct SF: $O(NK)$ phases per direction

Grid once at common σ_g , FFT in $O(P \log P)$

Leftover sharpness: $B_{res} = 8\pi^2(\sigma^2 - \sigma_g^2)$

$$B = 8\pi^2\sigma^2 \iff e^{-Bq^2/4} = e^{-2\pi^2\sigma^2q^2}$$

Requirement: $\sigma_g \leq \min_j \sigma_j$
